```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid for the in situ hybridisation, in Southern, Northern or dottoprobes is useful in in situ hybridisation, in Southern, Northern or dottoprime extensions of any gene, in mapping the 5' termin of mutations of any gene, in mapping the 5' termin of mutations of any gene, in mapping the 5' termin of mutations of any gene, in mapping the 5' termin of mutations of any gene, in mapping the 5' termin of mutations of any gene, in mapping the 5' termin of mutations of any gene, in mappendic acid probes incorporated in the microarray. Note: The sequence containing segments of DNA that have been incorporated in the microarray. Note: The sequence of the mutations of any sequence of the microarray. Note: The sequence of the form USPPO at sequence of the microarray.
                                                                                                                                                                                                                                                                                                                                                                                                                              New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; SEQ ID NO 60525; 9pp; English.

This invention describes a novel method for the detection of a mammalian infection by an acid-resistant microorganism (A) by treating a faecal sample with at least two different monoclonal antibodies (MAD) for their fragments or derivatives) or aptamers (collectively (I)) and detecting formation of a complex (C) between (I) and the corresponding antigen of formation of a complex (C) between (I) and the corresponding antigen of (A). The first and second (I) bind to epitopes of different antigens (Ag). These epitopes are present, after passage through the intestines, in at least some mammals, and have either: (i) their native structure; or (ii) a structure against which an antibody is produced by an animal ciffered or immunized with (A), or its extract, lysate, derived protein or fragment, or with a synthetic peptide. Practically all mammals display or least one of the specified epitopes. The method is used to detect infection by acid-fast bacteria, particularly of the genera Helicobacter, Mycobacterium and Campylobacter, specifically H. Pylori, H. hepaticus, M. therapeutically. The method is direct and non-invasive, and provides an inexpensive and easily standardizable diagnosis, despite possible degradation of antigens during passage through the intestines. This sequence encodes a fragment of a H. Pylori beta-urease-binding antibody illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting infection by acid-fast microbes for diagnosis of Helicobacter pylori, comprises reacting a fecal sample with two binding reagents for antigens that survive intestinal passage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           69.0%; Score 13.8; DB 3; Length 33; 88.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expression. The antisense oligonucleotides were designed to target carpersation. The antisense oligonucleotides were designed to target carpersations of the human MEKKS RNA, and were analysed for their effect on MEKKS mRNA levels by quantitative real-time PCR. MEKKS (also known as mitogen-activated protein kinase kinase 5, MEK kinase 5, apoptosis signal-regulating kinase 1, and ASK1) is a dual-specific serine/threonine kinase which mediates cellular responses to mitogenic stimuli by activating both the JNK/SAPK (JUN N-terminal kinase/stress-activated protein kinase) and p38 modules of MAP carminal kinase/stress-activated protein kinase) and p38 modules of MAP capulation of apoptosis (programmed cell death) by interacting with other spotesis in this cascade and by phosphorylating downstream targets such as MKK3 and SEKI. MEKK5 as participates in another apoptosis-related signalling cascade involving the modulation of transcription factors. Activation and dimerisation of MEKK5 is induced by tumour necrosis factor-alpha (TNP-alpha), these processes being mediated by reactive oxygen capetions are useful for diagnosis, prevention and treatment of conditions associated with MEKK5 expression, such as inflammation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             °,

This invention describes a novel method for detecting, in a mammal, infection by an acid-resistant microorganism (A) which comprises reacting a fecal sample with: (i) a receptor (R) such that a complex is formed with an antigen (Ag) of (A), or (ii) two different R so that a three-part complex is formed with Ag, and the formation of a complex detected. R are specific for an Ag which, after passage through the intestines, at least in some mammals, retains a native (or corresponding) structure against on its extracts, lysates or derived proteins (or fragments) or synthetic peptides). The products of the invention have antibacterial activity. The method is used to diagnose infection by Helicobacter, Campylobacter or Mycobacterium, particularly H, pylori (most preferred), H, hepatica, C. jejuni and M. tuberculosis, and also to monitor the progress of treatment. Receptors, particularly antibodies, directed progress of treatment. Receptors, particularly antibodies, directed against Ag can be used therapeutically for treatment of infections. The method requires only one R to provide a reasonably secure diagnosis (although use of two R improves sensitivity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Geranylgeranyl diphosphate synthase; GGPP synthase; yew; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acid-resistant microorganism (A), in a mammal, using immercion by an acid-resistant microorganism (A), in a mammal, using immunochromatography. The method is used to diagnose infection by an acid resistant microorganism (A), in a mammal, such as Helicobacter. Campylobacter or Mycobacterium, particularly H. pylori (most preferred), H. hepatica, C. jejuni and M. tuberculosis. The method is rapid, simple, inexpensive and non-invasive, and may indicate the stage of infection. A test strip used in the method may include a filter to eliminate particles present in the sample and only a single receptor provides a reasonably secure diagnosis, with specificity and selectivity improved by detecting several epitopes (of catalase) or different antigens (catalase and betaurease). The method can be automated. This sequence encodes a
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting infections by acid-resistant microorganisms, particularly for diagnosing Helicobacter pylori, comprises immunochromatographic detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Heavy chain; light chain; catalase; beta-urease; detection; CDR; antigen; infection; acid-resistant microorganism; fecal; antibody; diagnosis; antibacterial; complementarity determining region; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              complementarity determining region (CDR) from an antibody raised against the H. pylori catalase or beta-urease antigen which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method for detecting infection by an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present sequence represents a PCR primer for a geranylgeranyl diphosphate (GGPP) synthase protein. GGPP synthase has cytostatic activity. A vector encoding GGPP synthase is useful in increasing GGPP synthase levels in a host cell preferably Taxus (Yew) cell and thereby facilitates production, isolation and purification of larger amounts of GGPP synthase in plants. GGPP synthase is useful in obtaining expression or enhanced expression of GGPP and other diterpens, such as paclitaxel, useful as anticancer drugs. Isolated nucleic acids encoding GGPP synthase or hybridising with GGPP synthase encoding nucleic acids are used for identifying genes encoding GGPP synthase from microorganisms such as
                                                                                                                                                                                                  Nucleic acid encoding geranylgeranyl diphosphate is useful for producing paclitaxel and other diterpenes that are useful as anticancer drugs.

Polypeptide-HOMO DNA-dependent 2-hydroxy acid dehydrogenase family protein 26.29 and encoding polynucleotide, used in diagnosis and treatment of e.g. malignant tumors, hemopathy, immunological diseases and phlogosis.

```
The invention relates to HOMO DNA-dependent 2-hydroxy acid dehydrogenase family protein 26.29 with cytostatic, virucidal, immunomodulatory, antinfilammatory and haemostatic activity. The protein and encoding polynucleotide are used in diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The polynucleotide is useful in gene therapy. The present sequence is that of a HOMO DNA-dependent 2-hydroxy acid dehydrogenase family protein 26.29 PCR primer, useful in examples of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for producing 1,3-propanediol from a carbon source, comprising culturing a recombinant microorganism having glycerol dehydratase and/or 1,3-propanediol dehydrogenase from Clostridium butyricum (see AAB73300, AAB80887 and AAB80889). The method of the present invention is useful for the production of 1,3-propanediol, which is useful as a stabiliser for lipases, amylases and proteases in wash liquids, as a protective emollient in liquid detergents for hand and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Production of 1,3-propanediol comprises culturing a recombinant microorganism expressing coenzyme B12-independent glycerol dehydratase.
                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                dish washing, and as a monomer for producing polymers, especially polyesters, polyethers and polyurethanes. The present sequence is a promoter sequence, for glycerol dehydratase, which was used in the

Also disclosed is a method of gene expression analysis. The array is used in manitoring gene expression levels by hybridisation to a DNA library, or naulysis of geneit variation or in hybridisation to a DNA library, or factoring gene expression levels by hybridisation to a DNA library, of at least one target sequence. The method of analysis comprises compounds. The nucleic acid probes are specifically designed for analysis of probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring can eamily members of a gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gen and a cross-species comparison. Bach of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes in ni situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termin of mRNA molecules by primer extensions or in screening only and primer extensions or independent of many hyper hyperical many probes in screening only and proper many and a probes or subclones
                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at seqdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                        Gaps

Suggenties Android-Tables in the manner of the suggesties which contains bidglefic polymorphic markers. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in a method for determining polymorphic forms in an individual. The invention further provides computer-readable storage medium for storing data for access by an application programme being executed on a data processing system. Such a method comprises a data structure stored in the computer-readable storage medium, the data structure including information records, each record comprising structure including information records, each record comprising information factors and methods can be used for analysing polymorphic sites in information should be used for analysing polymorphic sites in individuals for testing for the presence of a disease phenotype or in formation; paternity testing or genetic mapping of phenotypic traits. They can also be used for the production of transgenic animals. The nucleic acid segments can also be used in the manufacture of medicaments for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ACD50544
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence that encodes an enzymatically active BLM protein. This is used in the Single-Strand Conformation Polymorphism (SSCP) Analysis of the BLM gene. SSCP analysis helps in identifying the mutants in the BLM gene. Bloom's syndrome is diagnosed by detecting 2 mutated BLM genes or the absence of a wild-type BLM gene in a subject. Delivery of a functional BLM gene to bone marrow cells is used to treat or prevent the onset of Bloom's syndrome. Identification of the BLM gene and its products should assist in the development of therapeutic and diagnostic agents for cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Diagnosing Bloom's syndrome, and carriers, by detecting mutant BLM genes - for gene therapy with nucleic acid encoding active BLM protein to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion of a promoter replacement fragment with a heterologous recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the compound catabolism biosynthetic, transporter, transcriptional, compound catabolism biosynthetic, transporter, transcriptional, compound is useful for identifying a compound having the activity. The method is useful for identifying a compound having the activity to inhibit growth or proliferation of cataborans cells and for treating infection by C. albicans. The present sequence is that of a PCR brine trans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus, HBV; RNA stability, RNA expression, RNA synthesis, antisense; enzymatic nucleic acid, hammerhead ribozyme; DNAzyme; inozyme; zinzzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptemer; HBV reverse transcriptase; Enhancer I region; viral replication;

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, include antisense care nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV C as oligonucleotides that specifically bind the Enhancer I region of HBV C Genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds and/or potential therapies directed against HBV, and compounds and/or potential therapies directed against HBV, and compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, inozyme, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
degenerative, disease state, HBV infection, HCV infection, cirrhosis, liver failure, hepatocellular carcinoma, hepatotropic, cytostatic, virucide, antiinflammatory, substrate, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      ä

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as harmerhead ribozymes, DNazymes, inczymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular cardinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences disclosed in the present invention
                                                                                                           Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 17 BP; 5 A; 3 C; 3 G; 0 T; 6 U; 0 Other;

A probe set (QQ21865-8) was designed to hybridise to the target sequence for use in pre-amplification. The 3' end of probe 179.3 was haptenated with biotin-aminocaproyl NHS active ester. See also

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Compounds an expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, or at least one target sequence. The method of analysis comprises of at least one rarget sequence. The method of analysis comprises of at least one or more nucleic acid probes are specifically designed for analysis of at least one or more nucleic acids to at least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises of the array of nucleic acids further comprises of the sequence or specific probes is useful in in situ hybridisation, in Southern, Northern or dotor mutations of any gene, in mapping the 5' termini of mRNA molecules by containing segments of DNA that have been containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the solute for this patent can also be obtained in electronic format directly compared in the microarray. Note: The sequence of the data for this patent can also be obtained in electronic format directly the sequence of the data for this patent sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present libration letaces to muchato actual sequences that are compelementary to particular genes, and can be used as probes for a variety of analyses such as gene expression analysis. Each probe compenses 9 or more consecutive nuclectides from at least one of 14936 nucleotide sequences defined in the patent, or their perfect sense match, sense mismatch, antisense match or antisense match or antisense match of an instance of a monitoring gene expression concleic acid probes. The array is useful in monitoring gene expression levels by hybridisation to a DNA library, in analysing genetic variations, and in hybridisation are labelled compounds. The probes are also useful in in situ hybridisations, in screening companions are also cuseful in in situ hybridisations. In screening containing segments of DNA that have been previously isolated and sequenced, in Southern, northern, or det-blot hybridisation of genomic DNA to identify or detect the sequence of any gene or detect specific mutations in any gene, and in mapping the 5' termini of mRNA molecules by primer extensions. The mapping the 5' termini of mRNA molecules by primer extensions. The mapping the sylvaticular genes with a wide range of analytical uses. Complementary to particular genes with a wide range of analytical uses. The analytical uses of the invention provides a large collection of mucheces of the invention. Note:
               The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its operfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression nalysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises compounds are attached to a solid support. The analysis comprises molectic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence or specific contactions of any gene, in mapping the 5' termini of mRNA molecules by comparisons or in screening contactions of any sequenced. The sequence or specific for additional subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence or sequence and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence or sequence and previously sequence. The microarray is sequence. The sequence or sequence and previously sequenced. The sequence presented is one of the sequence or sequence. The sequence or sequence or sequence or sequence or sequence or sequence. The sequence or sequence or sequence or sequence or sequence or sequence or sequence. The sequence or sequence or sequence or sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 25 BP; 4 A; 4 C; 5 G; 12 T; 0 U; 0 Other;

The present invention relates to nucleic acid sequences that are complementary to particular genes, and can be used as probes for a variety of analyses such as gene expression analysis. Each probe comprises 9 or more consecutive nucleotides from at least one of 14936 nucleotide sequences defined in the patent, or their perfect sense match, sense mismatch, antisense match or antisense mismatch oligonucleotides. The probes may be used in an array comprising at least 10 distinct mucleic acid probes. The array is useful in monitoring gene expression levels by hybridisation to a DNA library, in analysing genetic cusful for identifying family members of a gene. The probes are also useful in in situ hybridisations, in screening cDNA or genomic libraries (or derived subclones) for additional clones containing sequents of DNA that have been previously isolated and sequenced, in Southern, northern, or dot-blot hybridisation of genomic DNA to identify or detect the sequence of any gene or detect specific mutations in any gene, and in mapping the 5' termini of many molecules by primer extensions. The sequences of the invention are also useful as PCR primers.

Complementary to particular genes with a wide range of analytical uses. ACH50855-ACH65260 represent the target sequences of the invention. Note: The sequence data for this patent was obtained in electronic format correctly from the USPTO web site at sequences. New probe array useful e.g. for monitoring gene expression levels, for analyzing genetic variations, or for hybridizing tag-labeled compounds, comprises multiple nucleic acid probes. Oat Beta-amyrin synthase sequencing primer 64.

Oat, Beta-amyrin synthase; triterpenoid, palatability, oxidosqualene cyclase; pathogen resistance; transgenic plant; fungal disease; sequencing primer; ss.

The sequence represents a primer used to sequence nucleic acids encoding CC Oat Beta-amyrin synthase (an oxidosqualene cyclase). Beta-amyrin is a triterpenoid responsible for paltablity to animals and resistance to pathogens and predators. The beta-amyrin synthase encoding nucleic acid is useful for producing a transgent plant, by introducing a vector containing it into a host cell, optionally causing or allowing crecombination between the vector and the host cell genome so as to transform the host cell, and regenerating a plant from the transformed plant cell. The DNA is also useful for identifying, cloning or determining the presence of a nucleic acid in a sample and for influencing or affecting the quantity or quality of triterpenoid synthesis, preferably an oleanane-type triterpene saponin synthesis, in a scomycete having a strond-containing membrane, optionally selected from ascomycete parting resistance to a fungal pathogen e.g., an accomycete parting vars tritici and avenae, fusarium culmorus, F. Gaeumannomyces graminis vars tritici and avenae, fusarium culmorus, F. CC avanaceum, Stagonospora nodorum or S. avenae, taste, palatability and/or nutritional value, of the plant, by causing or allowing expression of the for reducing the level of trierpenoids in the plant, by causing or allowing expression from an antisense molecule in the plant, allowing transcription from the DNA, or its part such as to reduce beta-amyrin cyluboryme specific for the DNA Novel beta-amyrin synthase encoding nucleic acids useful for influencing or affecting triterpene synthesis, and hence resistance to fungal pathogen, taste, palatability or nutritional value of plants. ```
The invention relates to an isolated, soluble, catalytically active human effector checkpoint protein kinase (Chk1) polypeptide. Chk1 protein can be expressed by standard recombinant methodology. Chk1 is useful for screening for its inhibitors, used for treating hyperproliferative diseases, such as, HIV and cancer. The Chk1 DNA is useful for probes, primers, chemical intermediates, and in biological assays. Sequences AAF83283-290 represent PCR primers for amplifying the human Chk1 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying constants assette having an expressible selectable marker and modifying other allele by insertion or replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that cells in which both alleles modified are useful for identifying a gene that cells in which beth alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus agent, an antifungal agent that inhibits the growth of a diploid fungus or and for identifying a compound without activity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, signal transduction, DNA replication and cell division attivity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a pCR primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             genomic map; haplotype; phenotype; polymorphic base; genotyping;

invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallellic markers. The biallellic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential effications responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the AAZ65654 to AAZ69578 represent human biallelic markers from the present Gaps . 0 64.0%; Score 12.8; DB 3; Length 47; 87.5%; Pred. Leach M;

Shimkets RA,

Isolated human nucleic acids comprising one or more single nucleotide polymorphisms, useful for treating a subject suffering from a pathology, e.g. autoimmune diseases, ascribed to the presence of a sequence polymorphism.

This invention describes a novel avian-paramyxovirus cDNA (I) which comprises a nucleic acid sequence corresponding to the 5' terminal end of the genome of avian-paramyxovirus allowing the generation of an infectious copy of avian-paramyxovirus. The cell line is useful for the production of infectious lentogenic NDV (Newcastle Disease virus) without the addition of exogenous proteolytic activity. Also it is possible to generate a stable transfected cell line that expresses the wild-type F protein in the virus envelope therefore providing infectious particles, useful in the form of a vaccine, especially against respiratory and/or

```
The invention relates to genes in S. cerevisiae which are essential for germination and proliferation. The essential genes (EG) such as YDR141C, YDR091C, YOLO26C, YOLO34W and YOL077C are used in a method for identifying potential antifungal compounds (CP). The method comprises overexpressing the EG cells, isolating a subset of genes induced to repressed by overexpression of EG and determining effect of Cp on down/up requilation of any subset of genes or contacting a protein encoded by EG with Cp and determining binding between them. Cp is identified as a potential antifungal Cp, if it downregulates a gene that is induced by coverexpression of EG or if it downregulates a gene that is induced by coverexpression of EG or if it upregulates the gene that is repressed by the method is useful for identifying novel antifungal compounds for treating fungal diseases and proliferative discorders in human and nontum mammals, including monkeys and other primates, dogs, cats.

Sequences AAFB623273-280 represents PCR primares for the construction and
gastrointestinal diseases. NDV can be easily cultured to very high titers in embryonated eggs. Mass culture of embryonated eggs is relatively cheap. NDV vaccines are relatively stable and can be simply administered by mass application methods e.g. drinking water or by spraying or by acrosol formation. The natural route of infection is by the respiratory and/or gastrointestinal tract which are also the major routes of infection of many other poultry pathogens. NDV can induce local immunity despite the presence of circularing maternal antibody. AAZ44527-Z44609

This sequence represents an example of the first probe used for genotyping Mycobacterium species. The array is useful for simultaneously genotyping Mycobacterium species, differentiating M. tuberculosis strains and detecting antibiotic-resistant strains

This invention describes the isolation of a novel Staphylococcus aureus ATPase subunit of preprotein translocase (SecA). SecA polypeptides and polymerolecides are useful for diagnosing diseases related to over or underexpression of SecA protein by identifying mutations in the SecA gene, or determining SecA polypeptide or mRNA expression levels due to an infection of an organism with the SecA gene. They can diagnose the stage infection of an organism with the SecA gene. They can diagnose the stage of infection. SecA polypeptides can be used in treatment to inhibit (antagonist i.e. antibacterial drugs) or enhance (agonist) SecA critisty. Diseases diagnosed, prevented or treated include bacterial infections, especially Staphylococcus aureus infections of the upper and lower respiratory tract (e.g. otitis media, thyroiditis), cardiac (e.g. infections of endocarditis), gastrointestinal (e.g. secretory diarrhoes, infections), kidney and urinary tract (e.g. toxic shock syndrome), skin (e.g. impetigo, wound infection), and bone and joint (e.g. septic arthritis, osteomyelitis). SecA polypeptides, polynucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins) are useful for use on wounds and body implants to prevent bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New Staphylococcus aureus ATPase subunit of preprotein translocase (SecAs) polypeptide and polymuclostide - useful as diagnostic reagents and for prevention and treatment of Staphylococcus aureus infections, including toxic shock syndrome and splenic abscess.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       20-JAN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Warren R,
```

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 128010; 9pp; English

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises thybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific or mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening segments of DNA that have been to repet in source or specific or isolated and previously sequence. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, and analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence in the method of analysis comprises of hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific concluded any gene, in mapping the 5' termini of mand molecules by the primar extensions or in screening cDNA or genomic libraries or subclones confatiling segments of bNA that have been contacted the contacted or any sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at segdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 36372; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises for uncleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises to a green and a cross-species comparison. Each of the concleic acids further comprises to tag sequence. The array of nucleic acid further comprises to the sequence or specific comparations of any gene, in mapping the 5' termini of mRNA molecules by complement subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence contained to the sequence contained in electronic format directly from USPTO at sequence. Then also be obtained in electronic format directly from the sequence of the contained in electronic format directly from the contained in electronic format directly from the contained in electronic format directly from the contained in the microarray.

Human microarray DNA oligonucleotide SEQ ID NO 65195. (first entry) 13-OCT-2003 ACI65204; XEXEX

ACI65204 standard; DNA; 25 BP.

RESULT 32 ACI 65204

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in bybridisation to a DNA library. CC in analysis of genetic variation or in bybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring concern expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid subport in situ hybridisation, in Southern, Northern or dotonce is useful in in situ hybridisation, in Southern, Northern or dotonce additional subclones containing segments of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and probes incorporated in the microarray. Note: The sequence date for this patent can also be obtained in electronic format directly from the containing the sequence them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, in analysis of genetic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acid statements. The nucleic acid probes and detecting the hybridisation. The nucleic acid forces are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific or mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or an screening segments of DNA that have been consolations acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly concluded in electronic format directly concluded in the microarray. New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene. The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, or nanitoring gene expression levels by hybridisation to a DNA library, or property and probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring compensation levels, identifying biallelic markers or polymorphisms, or family members of a gene across-species comparison. Each of the nucleic acids further comprises at an sequence. The array of nucleic acid control of an across-species comparison. Each of the nucleic acids further comprises at an sequence. The array of nucleic acids further comprises at an sequence or specific acid control of an across-species comparison of a control of an across-species comparison. Each of the mutations of any gene, in mapping the 5' termin of mRNA molecules by thimer extensions or in screening cNNA or genemanic libraries or subclones for a shift control such and a cross-species or subclones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                        New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 25 BP; 7 A; 3 C; 5 G; 10 T; 0 U; 0 Other;

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its component match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by bybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of genetic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises comprises the probes are attached to a solid support. The metalysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific acid further comprises a tag sequence or specific acid further comprises a tag sequence or specific acid further comprises or the sequence or specific acid probes is useful in in situ hybridisation, in Southern, Northern or dottore hybridisation to identify or detect the sequence or specific acid probes in mapping the 5' termini of mRNA milecules by commutations of any gene, in mapping the 5' termini of mRNA milecules by commer extensions or in screening SONA or genomic libraries or subclones is solated and previously sequenced. The sequence presented is neceptated in the microarray. Note: The sequence or format directly from USPPO at sequence. The libraries or subclones and so be obtained in electronic format directly from the sequence or the sequenc

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in manlysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises in hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Bach of the nucleic acids further comprises a tay sequence. The array of nucleic acid further comprises a tay sequence. The array of nucleic acid further comprises a tay sequence. The array of nucleic acid further comprises a tay sequence. The array of nucleic acid for any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Noce: The sequence containing the contain
                                                                                                                                                                                                                                                                                           New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in manitoring gene expression levels by hybridisation to a DNA library, and nonitoring gene expression levels by hybridisation to a DNA library, of a nanitysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of the least one target sequence. The method of analysis comprises for nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring concern attached to a solid support. The analysis comprises monitoring can expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a torge species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid sorbes is useful in in situ hybridisation, in Southern, Northern or dotbrobe the hybridisation to identify or detect the sequence or specific mitations of any gene, in mapping DNA or genemic libraries or subclones for additional subclones when have hear

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 35597; 9pp; English.

for additional subclones containing segments of DNA that have been isolated and previously segmenced. The segmence presented is one of the nucleic acid probes incorporated in the microarray. Note: The segmence data for this patent can also be obtained in electronic format directly

Sequence 25 BP; 4 A; 5 C; 7 G; 9 T; 0 U; 0 Other; from USPTO at segdata.uspto.goc/sequence.html

                                                                                                                                                              mapped to human chromosome 110. ASTHII and ASTHII are genes present within the locus, located close to each other on human chromosome 11p, and have similar patterns of expression, and common sequence motifs. The ASTHI genes and fragments, encoded protein, agenomic regulatory regions and anti-ASTHI antibodies are useful in the identification of individuals predisposed to development of asthma, and for the modulation of gene activity in vivo for prophylactic and therapeutic purposes. The ASTHI protein is useful as an immunogen to raise specific antibodies, in drug screening for compositions that mimic or modulate ASTHI activity or expression, including altered forms of ASTHI protein, and as a therapeutic. Sequences AAZH8510-Z18631 represent POR primers for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ASTH1 polymorphic microsatellite marker AFMA154ZD1 primer, SEQ ID NO:223.
                                                                                                 Mammalian asthma related genes, useful for diagnosis of a predisposition to development of asthma.
                                                                                                                                                       The invention identifies a genetic locus ASTH1, associated with asthma,

The invention relates to the ASTH1 locus on the short arm of human chromosome (11p). This locus comprises the ASTH1I and ASTH1J genes, which chromosome (11p). This locus comprises the ASTH1I and ASTH1J genes are oriented in opposite are associated with the ASTH1 and ASTH1J and batterns of expression and rections with the ASTH1 and ASTH1J are novel members of expression and common sequence motifs. They are both expressed in trached, lung and common sequence motifs. They are both expressed in trached, lung and common sequence motifs. They are both expressed in trached, lung and common sequence motifs. They are both expressed in trached, transcription factors, which have been implicated in the common sequence motifs. They are both expressed in trached, attentively spliced. Alternative splicing of ASTH1I muth a setiology of asthma. Both ASTH1I and ASTH1I mansoripts has no effect on the open reading frame of ASTH1J as the expression of the start codon in exon b. In contrast, a leoforms. The invention also encompasses mouse asth1j protein. The ASTH1I conclete acids are useful as dagnostics to identifying ASTH1 related genes, for identifying expression of the gene in a biological specimen, and for generating geneticinally modified non-human animals or site specific gene (modifications that aminc or modulate activity or expression of ASTH1I compositions that aminc or modulate activity or expression of ASTH1I compositions that aminc or modulate activity or expression of ASTH1I compositions that aminc or modulate activity or expression of ASTH1I compositions that aminc or modulate activity or expression of ASTH1I compositions that aminc or modulate activity or expression of ASTH1I compositions that aminc or modulate activity or expression of ASTH1I and as a theorem of activity in vivo for compositions that aminc or modulate forms of these proteins or reduce that the activity and activity and activity in vivo for prophylactic and therapeutic purposes. The intract ASTH1I and therapeutic purposes to favore also proteins or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;
0
New nucleic acids other than naturally occurring chromosomes encoding ASTH1 protein, for e.g. screening compositions that modulate expression or function of ASTH1 proteins or as diagnostics for genetic predisposition to asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
CDNA sequence AAQ37477, encoding a neutrotrophic factor (NF), was derived from the native ciliary neurotrophic factor (CNTF) (e.g. EP-385060) by PCR amplification. In order to obtain a DNA sequence encoding the NF(1-180), a portion of the DNA sequence encoding AAs 76-180 of full-length CNTF was amplified using PCR from a bacterial expression vector, plasmid pSP18 and synthetic PCR primers AAQ37473 and AAQ37474. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homogeneous neurotrophic factor for treating neuro-degenerative diseases, e.g. Parkinsonism - comprise specified polypeptide sequence lacking micro-heterogeneity associated with a related native sequence factor.
                                                    to the sense strand for AAs 76-87
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel human NOV proteins and their coding sequences (ACC72075-ACC72181 and ABR58363-ABR58469). The NOV proteins are useful in manufacturing a medicament for treating a syndrome associated with a human disease. The NOV proteins and coding sequences may be used to diagnose, treat or prevent metabolic disorders such as disbetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The present sequence is a PCR primer, used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              or

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ008152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    T7; leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to novel isolated aptamers comprising at least one base capable of base pairing and different from the standard Watson-Crick (W-C) bases. The invention also comprises a method for sequencing nucleic acids. The aptomers of the invention are useful for isolating a specific acids. The aptomers of the invention are useful for isolating a specific ligand from a pool of ligands, by providing at least one specific aptamer. The aptomers of the invention are useful for detection of specific ligand from a biological sample, by selecting at least one specific aptamer, capable of binding to a specific ligand from a biological sample, mixing the at least one specific aptamer. The abiological sample to allow binding of the ligand to the specific one aptamer, and detecting the presence and/or quantity of the specific ligand from the biological sample bound to at least one aptamer. The captamer of the invention is useful as a drug and for therapeutic treatment. The present sequence represents a 50 bp spacer oligonucleotide used in the construction of an aptamer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ·

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ003152) each having 50 base pairs (Dp). The system is useful for leukocyte expression profiling. It is particularly useful for

New system for leukocyte expression profiling, diagnosing a disease, or

for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, ridney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                                                                                                                                                                                                                      Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by complete and promoter replacement fragment with a heterologous recombination, of a promoter replacement fragment with a heterologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that cells having both alleles modified are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon

compound catabolism, biosynthetic, transporter, transcriptional, translational, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 58587, Application US/10027632
Publication No. US2020198371A1
GENERAL INFORMATION:
APPLICANT: Wang, David G.
TITLE OF INVENTION: Identification and Mapping of Single Nucleotide
TITLE OF INVENTION: Polymorphisms in the Human Genome
TITLE OF INVENTION POLYMORPHISMS in the Human Genome
TITLE OF INVENTION NUMBER: US/10/027,632
CURRENT FILING DATE: 2002-04-30
PRIOR APPLICATION NUMBER: US 60/218,006

Patent No. 634673B;
GENERAL INFORMATION:
APPLICANT: Stanley, Christopher John
APPLICANT: Orum, Henrik
APPLICANT: Orum, Henrik
TITLE OF INVENTION: Nucleic Acid Analogs With A Chelating Functionality
FILE REFERENCE: 100382-004086,726
CURRENT APPLICATION NUMBER: US/09/086,726
CURRENT PILING DATE: 2001-07-10
PRIOR FILING DATE: 1996-05-24
PRIOR FILING DATE: 1996-05-24
PRIOR FILING DATE: 1994-11-25
PRIOR FILING DATE: 1993-11-25
NUMBER OF SEQ ID NOS: 11
SOFTWARE: PatentIn version 3.1

Patent No. 5650553
GENERAL INFORMATION:
APPLICANT: Ecker, Joseph R. et al.
TITLE OF INVENTION: Plant Genes for Sensitivity to Ethylene
TITLE OF INVENTION: and Pathogens
NUMBER OF SEQUENCES: 82
CORRESPONDENCE ADDRESS:
ADDRESSEE: Woodcock, Washburn, Kurtz, Mackiewicz & No. 5650553ris
STREET: One Liberty Place, 46th floor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Sequence 30, Application US/09462941

Patent No. 6608183

GENERAL INFORMATION:

APPLICANT: Cox III, George N

APPLICANT: Bolder Biotechnology, Inc.

TITLE OF INVENTION: Deliverives of Growth Hormone and Related Proteins

FILE REFERENCE: 4152-1-PUS

CURRENT APPLICATION NUMBER: US/09/462,941

CURRENT PILING DATE: 2000-01-14

PRIOR FILING DATE: 1997-07-14

NUMBER OF SEQ ID NOS: 41

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 30
